

Use-Case Flow Specification

Use Case: Submit Elective Bid

Primary Actor: Student

Problem Statement #05 — Academic Elective Bidding & Allocation System(NAME: Omkar, SRN:PES1UG24CS310)

Preconditions

- The student is authenticated and logged into the elective bidding portal.
- The bidding window is currently open (current time is before the published deadline).
- The elective catalog for the term has been published by the Academic Registrar.

Postconditions

- A valid bid (ranked electives with credit distribution) is recorded against the student, with the allocated credits locked.
- The student receives a confirmation with a timestamp; the bid becomes visible to the allocation solver for the next run.

Main Success Scenario

1. Student logs into the portal and opens the Elective Bidding module. System displays the published list of available electives with seats and timetable slots.
2. Student ranks preferred electives and distributes portions of their 100 bidding credits across the ranked list.
3. Student submits the bid.
4. System validates that total allocated credits do not exceed 100.
 1. System validates that the student has completed the prerequisite(s) for each ranked elective (includes «Validate Prerequisites»).
 2. System locks the credits associated with the submitted bid.
 3. System displays a confirmation screen showing the submitted ranking, credit distribution, and submission timestamp.
 4. Use case ends successfully.

Alternate Flow — Credits Exceed 100 (at step 4)

- System detects that the total allocated credits exceed 100 and rejects the submission, displaying an error that highlights the amount over budget.
- Student adjusts the credit distribution across the ranked electives.
- Student resubmits the bid — flow resumes at step 3 of the Main Success Scenario.
